# Sterile Disinfectants

USP chapter <797> describes the conditions, practices and quality standards for compounded sterile preparations (CSPs) of drugs and nutrients. A cleanroom, as defined in USP <797>, is a room in which the concentration of airborne particles is controlled to meet a specified airborne particulate cleanliness class. Microorganisms in the environment are monitored so that a microbial level for air, surface, and personnel gear are not exceeded for a specified cleanliness class. It is essential that the disinfectants used to remove contamination do not bring contamination into the cleanroom environment. Thus sterilized products takes care of the aforesaid procedures and guarantees availability of sterile, effective and proven products for clean room usage.
